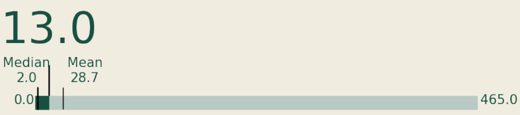
Malé is a picturesque village located in the Trentino region of Italy, known for its stunning alpine scenery and rich cultural heritage. It serves as a hub for outdoor activities, including hiking and skiing, and is characterized by its charming architecture and vibrant local community.

Village Smartness Index

A village smartness index value of 0.03 indicates a low level of smartness in comparison to the overall range observed in the research. This value suggests that the village may have limited access to smart technologies and infrastructure, which could hinder its development and innovation potential. The index reflects the village's current capabilities in areas such as mobility, governance, economy, environment, living, and people. With a mean value of 0.07 and a median of 0.01, this village is slightly above the minimum but still indicates significant room for improvement in enhancing its smartness and overall quality of life for its residents.

Indicator 1.1.1

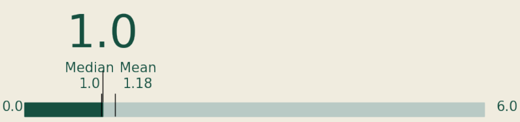
Measures the availability and quality of digital network connections within a rural community.



A smart village index indicator value of 13.0 suggests a moderate level of availability and quality of digital network connections within the rural community. This value indicates that while there are some digital resources and connectivity options present, they may not be fully developed or widely accessible to all residents. The presence of a value above zero signifies that there is at least some infrastructure in place, but it falls significantly short of the higher benchmarks observed in other villages. This could imply potential areas for improvement in enhancing digital connectivity and overall quality of life for the community.

Indicator 1.1.2

Assesses traditional, non-digital means of connectivity (e.g., postal services, telephony) to gauge infrastructure inclusivity in areas with limited digital access.



A calculated smart village index indicator value of 1.0 suggests a baseline level of connectivity and infrastructure inclusivity in the current location. This value indicates that while there are some traditional, non-digital means of connectivity, such as postal services and telephony, the overall infrastructure may still be limited. The presence of a value of 1.0 reflects a community that has made initial strides towards connectivity, but there remains significant room for improvement, especially in enhancing digital access and integrating more advanced technologies to support the local population's needs. This situation may also highlight challenges in data availability, which could further impact the assessment of the village's connectivity status.

Indicator 1.1.4

Examines the affordability and economic accessibility of internet services for rural residents, aiming to highlight potential barriers to digital engagement. [Internet café, libraries]

A calculated smart village index indicator value of 0.0 signifies a significant lack of digital engagement and accessibility in the current location. This value suggests that residents face substantial barriers to accessing internet services, which may stem from inadequate

P1 - Valle di Sole - Male

infrastructure, limited availability of internet cafes or libraries, and overall economic constraints. The absence of data could also indicate a lack of initiatives or resources aimed at improving digital connectivity, further isolating the community from the benefits of digital technologies. This situation highlights the urgent need for targeted interventions to enhance internet affordability and accessibility for rural residents.

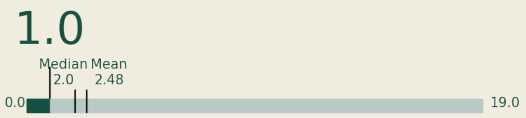
Indicator 2.1.1

This indicator measures the extent to which public transport services are available and accessible to rural populations, including frequency, coverage, and proximity of services. It reflects the inclusiveness and usability of the transport network in addressing mobility needs in sparsely populated areas.

A smart village index indicator value of 2.0 suggests a moderate level of public transport services available and accessible to the rural population in the current location. This value indicates that while there are some transport services in place, they may not be sufficient to fully meet the mobility needs of residents. The frequency, coverage, and proximity of these services likely require improvement to enhance inclusiveness and usability, ensuring that residents can effectively access essential services and opportunities. Overall, this value reflects a need for further development in the transport network to better serve the community.

Indicator 2.2.2

This indicator assesses the adoption and use of vehicles powered by low-carbon or renewable fuels, such as electric vehicles (EVs), plug-in hybrids, or vehicles running on biodiesel, in rural areas.



A calculated smart village index indicator value of 1.0 signifies a modest level of adoption and use of vehicles powered by low-carbon or renewable fuels within the village. This indicates that while there is some engagement with sustainable transportation options, it remains limited compared to the potential seen in other areas. The presence of low-carbon vehicles, such as electric vehicles or hybrids, suggests a growing awareness of environmental issues, but the overall impact on reducing carbon emissions and enhancing mobility in the village is still in its early stages. This value reflects the village's initial steps towards integrating sustainable transport solutions into its community framework.

Indicator 3.2.1

Measures the spread of localized energy generation facilities, enhancing local energy resilience.

A calculated smart village index indicator value of 0.0 signifies that the village in question exhibits no measurable presence of localized energy generation facilities, which are crucial for enhancing local energy resilience. This zero value may indicate a complete absence of data or infrastructure related to energy generation within the village. Consequently, the community may face challenges in energy access and sustainability, limiting its potential for development and self-sufficiency. The lack of localized energy solutions can hinder economic growth and the overall quality of life for residents.
