Village Smartness Index

A village smartness index value of 0.0 indicates that the village has not yet implemented any measurable smart initiatives or technologies that contribute to its development. This could be attributed to a lack of data, resources, or strategic planning for smart village initiatives. Such a low index suggests that the village may be facing significant challenges in areas such as governance, economy, and infrastructure, which are essential for fostering innovation and improving the quality of life for its residents. Without any smart solutions in place, the village may struggle to attract investment or enhance its services, ultimately hindering its growth and resilience.

Indicator 1.1.1

Measures the availability and quality of digital network connections within a rural community.

A calculated smart village index indicator value of 0.0 signifies that the specific rural community lacks any measurable availability or quality of digital network connections. This absence may indicate a significant digital divide, where residents are unable to access essential online services, information, or communication tools that are vital for modern living. The zero value could also suggest insufficient data collection or reporting mechanisms in place, highlighting a critical area for development and investment to enhance connectivity and improve overall quality of life in the community. Addressing this gap is essential for fostering economic growth and social inclusion.

Indicator 1.1.2

Assesses traditional, non-digital means of connectivity (e.g., postal services, telephony) to gauge infrastructure inclusivity in areas with limited digital access.

A calculated smart village index indicator value of 0.0 signifies a complete absence of assessed connectivity and infrastructure inclusivity in the current location. This could indicate a lack of traditional, non-digital means of connectivity, such as postal services or telephony, which are essential for gauging the area's accessibility. The zero value may also reflect insufficient data collection or reporting, highlighting significant gaps in infrastructure that hinder the community's ability to engage with both local and broader economic opportunities. This situation underscores the urgent need for targeted interventions to enhance connectivity and improve overall quality of life in the village.

Indicator 1.1.4

Examines the affordability and economic accessibility of internet services for rural residents, aiming to highlight potential barriers to digital engagement. [Internet café, libraries]

A calculated smart village index indicator value of 0.0 signifies a

0.0

complete absence of the necessary components or conditions that contribute to the development of a smart village. This could indicate a lack of digital infrastructure, such as high-speed internet access, or insufficient engagement with innovative technologies. In this context, the zero value may reflect barriers to digital engagement, such as economic inaccessibility or the absence of facilities like internet cafés or libraries that could support connectivity. Consequently, residents may face significant challenges in accessing online services and resources, limiting their opportunities for economic and social advancement.

Indicator 2.1.1

This indicator measures the extent to which public transport services are available and accessible to rural populations, including frequency, coverage, and proximity of services. It reflects the inclusiveness and usability of the transport network in addressing mobility needs in sparsely populated areas.

0.0

A calculated smart village index indicator value of 0.0 signifies a complete absence of public transport services available and accessible to the rural population in the assessed area. This indicates that there are no transport options in terms of frequency, coverage, or proximity, severely limiting mobility for residents. Such a scenario reflects significant challenges in inclusiveness and usability of the transport network, which is crucial for connecting individuals to essential services, employment, and social opportunities in sparsely populated regions.

Indicator 2.2.2

This indicator assesses the adoption and use of vehicles powered by low-carbon or renewable fuels, such as electric vehicles (EVs), plug-in hybrids, or vehicles running on biodiesel, in rural areas.

0.0

A smart village index indicator value of 0.0 signifies that there is no recorded adoption or use of vehicles powered by low-carbon or renewable fuels in the assessed location. This could indicate a lack of infrastructure, such as charging stations for electric vehicles, or limited awareness and availability of such vehicles among the residents. Additionally, it may reflect a reliance on traditional fuel sources, which can hinder the transition towards more sustainable transportation options. The absence of data could also contribute to this zero value, suggesting that further research and data collection are necessary to understand the transportation dynamics in this rural area.

Indicator 3.2.1

Measures the spread of localized energy generation facilities, enhancing local energy resilience.

A calculated smart village index indicator value of 0.0 signifies a complete absence of localized energy generation facilities within the village, indicating a critical lack of energy resilience. This zero value suggests that the village may not have any renewable energy sources or infrastructure in place to support local energy needs. Such a situation could stem from insufficient data collection or reporting, highlighting the need for improved energy initiatives and data management to foster local energy development and resilience. Addressing this gap is essential for enhancing the village's sustainability and overall quality of life.
