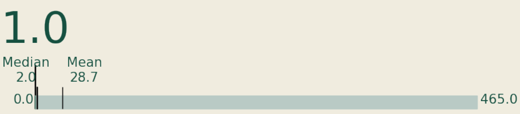
Port of Sóller is a picturesque village located on the northwest coast of Mallorca, Spain. Known for its stunning harbor, charming narrow streets, and vibrant local culture, it offers beautiful beaches, scenic tram rides, and access to the surrounding Tramuntana mountains, making it a popular tourist destination.

Village Smartness Index

A village smartness index value of 0.02 indicates a very low level of smartness in comparison to the overall range observed in the research. This value suggests that the village is in the early stages of adopting smart technologies and practices, with limited initiatives in areas such as mobility, governance, economy, environment, living, and people. The low index may reflect insufficient data or a lack of innovative projects and infrastructure, highlighting the need for targeted interventions to enhance the village's smartness and overall quality of life.

Indicator 1.1.1

Measures the availability and quality of digital network connections within a rural community.



A calculated smart village index indicator value of 1.0 suggests that the rural community has minimal availability and quality of digital network connections. This low score indicates that while there may be some level of connectivity, it is insufficient to meet the needs of the community effectively. The presence of a value above zero implies that there is at least a basic infrastructure in place, but significant improvements are necessary to enhance digital access and support the community's development goals. This situation may hinder opportunities for education, telemedicine, and local businesses, emphasizing the need for targeted interventions to improve digital connectivity.

Indicator 1.1.2

Assesses traditional, non-digital means of connectivity (e.g., postal services, telephony) to gauge infrastructure inclusivity in areas with limited digital access.

A calculated smart village index indicator value of 1.0 suggests a baseline level of connectivity and infrastructure inclusivity in the current location. This value indicates that while there are some traditional, non-digital means of connectivity, such as postal services and telephony, the overall infrastructure may still be limited. The presence of a value of 1.0 reflects a community that has made some progress in connectivity, but significant gaps remain, particularly in digital access and modern infrastructure. This situation may hinder the community's ability to fully leverage technological advancements for economic and social development.

Indicator 1.1.4

Examines the affordability and economic accessibility of internet services for rural residents, aiming to highlight potential barriers to digital engagement. [Internet café, libraries]

A calculated smart village index indicator value of 0.0 signifies a significant lack of digital engagement and accessibility in the current location. This value suggests that residents may face substantial barriers to accessing internet services, which could stem from inadequate infrastructure, limited availability of internet cafes or libraries, 0.0

or economic constraints that prevent them from affording such services. The absence of data may also indicate a lack of initiatives or resources aimed at enhancing digital connectivity, further isolating the community from the benefits of the digital age. This situation highlights the urgent need for targeted interventions to improve internet accessibility and foster digital inclusion for rural residents.

Indicator 2.1.1

This indicator measures the extent to which public transport services are available and accessible to rural populations, including frequency, coverage, and proximity of services. It reflects the inclusiveness and usability of the transport network in addressing mobility needs in sparsely populated areas.

6.0

A smart village index indicator value of 6.0 signifies a robust and highly accessible public transport system for the rural population in the current location. This value indicates that residents benefit from frequent, well-covered, and conveniently located transport services, effectively addressing their mobility needs. Such a high score reflects a commitment to inclusivity and usability within the transport network, ensuring that even in sparsely populated areas, residents can access essential services and opportunities, enhancing their overall quality of life.

Indicator 2.2.2

This indicator assesses the adoption and use of vehicles powered by low-carbon or renewable fuels, such as electric vehicles (EVs), plug-in hybrids, or vehicles running on biodiesel, in rural areas.

0.0

A calculated smart village index indicator value of 0.0 signifies that the specific location has not adopted or utilized any vehicles powered by low-carbon or renewable fuels. This could indicate a significant gap in the transition towards sustainable transportation options, which are essential for reducing greenhouse gas emissions and enhancing environmental sustainability in rural areas. The absence of data may also reflect limited access to infrastructure, resources, or incentives that promote the use of electric vehicles or other renewable fuel options. Consequently, this village may face challenges in achieving its sustainability goals and improving overall mobility for its residents.

Indicator 3.2.1

Measures the spread of localized energy generation facilities, enhancing local energy resilience.

A calculated smart village index indicator value of 0.0 signifies that the village has not demonstrated any measurable progress or presence in the area of localized energy generation facilities. This could indicate a complete absence of such facilities, which are crucial for enhancing local energy resilience. The zero value may also stem from insufficient data collection or reporting, reflecting a lack of investment or development in energy infrastructure. Consequently, the village may face challenges in energy security and sustainability, limiting its overall growth and resilience.
