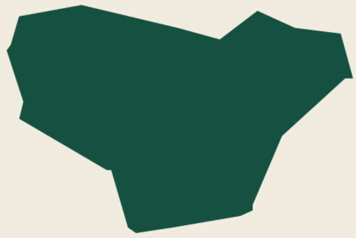
# P6 - Devetaki Plateau - Tepava



I'm sorry, but I don't have specific information about the village of Tepava in Bulgaria. If you have any other questions or need information on a related topic, feel free to ask! I'm here to help.

## Village Smartness Index

A village smartness index value of 0.0 indicates that the village has not yet implemented any significant smart initiatives or technologies that contribute to its overall smartness. This could be attributed to various factors, including a lack of data, resources, or strategic planning for smart development. Such a low index suggests that the village may be facing challenges in areas such as governance, economy, and infrastructure, which are essential for fostering innovation and improving the quality of life for its residents. Addressing these gaps is crucial for the village to progress towards becoming a smart village.

## Indicator 1.1.1

*Measures the availability and quality of digital network connections within a rural community.*

0.0

A calculated smart village index indicator value of 0.0 signifies that the specific rural community has no measurable availability or quality of digital network connections. This could indicate a complete absence of digital infrastructure, such as high-speed internet or mobile connectivity, which are essential for accessing information and services. The zero value may also reflect a lack of data collection or reporting in this area, highlighting significant challenges in digital integration and technological advancement within the community. This situation can hinder economic growth and limit opportunities for residents, emphasizing the need for targeted interventions to improve digital connectivity.

## Indicator 1.1.2

*Assesses traditional, non-digital means of connectivity (e.g., postal services, telephony) to gauge infrastructure inclusivity in areas with limited digital access.*

0.0

A calculated smart village index indicator value of 0.0 signifies a complete absence of measurable smart village characteristics in the assessed location. This could indicate a lack of data or significant deficiencies in traditional connectivity infrastructure, such as postal services and telephony, which are essential for gauging inclusivity in areas with limited digital access. Such a low value suggests that the community may not have the necessary resources or initiatives in place to support even basic connectivity, highlighting a critical gap in infrastructure that needs to be addressed for future development.

## Indicator 1.1.4

*Examines the affordability and economic accessibility of internet services for rural residents, aiming to highlight potential barriers to digital engagement. [Internet café, libraries]*

A calculated smart village index indicator value of 0.0 signifies a complete absence of the necessary components or infrastructure that contribute to the smart village concept. This could indicate that the village lacks essential digital services, connectivity, and resources that facilitate economic engagement and access to information technologies. The zero value may also reflect insufficient data collection or reporting, highlighting potential barriers to digital engagement for residents.

0.0

Median 0.0 Mean 0.36

0.0 2.0

Consequently, this situation underscores the urgent need for initiatives aimed at improving internet affordability and accessibility, which are crucial for fostering digital inclusion and enhancing the overall quality of life in rural areas.

# Indicator 2.1.1

20.0%

*This indicator measures the extent to which public transport services are available and accessible to rural populations, including frequency, coverage, and proximity of services. It reflects the inclusiveness and usability of the transport network in addressing mobility needs in sparsely populated areas.*

0.0

Median 0.0 Mean 0.67

0.0 6.0

A calculated smart village index indicator value of 0.0 signifies a complete absence of accessible public transport services for the rural population in the area. This indicates that there are no available transport options, such as buses or shared mobility services, which can significantly hinder residents' ability to access essential services, work, and education. The lack of frequency, coverage, and proximity of transport services reflects a critical gap in mobility infrastructure, limiting the community's overall connectivity and inclusiveness. This situation underscores the urgent need for improved transport solutions to enhance the quality of life for residents in this rural area.

# Indicator 2.2.2

10.0%

*This indicator assesses the adoption and use of vehicles powered by low-carbon or renewable fuels, such as electric vehicles (EVs), plug-in hybrids, or vehicles running on biodiesel, in rural areas.*

0.0

Median 2.0 Mean 2.48

0.0 19.0

A smart village index indicator value of 0.0 signifies that there is no recorded adoption or use of vehicles powered by low-carbon or renewable fuels in the assessed location. This could indicate a lack of infrastructure, such as charging stations for electric vehicles, or limited awareness and availability of such vehicles among the residents. Additionally, it may reflect insufficient data collection efforts in the area, preventing a comprehensive understanding of the local transportation landscape. Overall, this value highlights significant opportunities for improvement in sustainable mobility initiatives within the village.

# Indicator 3.2.1

10.0%

*Measures the spread of localized energy generation facilities, enhancing local energy resilience.*

0.0 0.0

A calculated smart village index indicator value of 0.0 signifies that there is no measurable presence of localized energy generation facilities within the village, which directly impacts local energy resilience. This zero value may indicate a complete absence of data or infrastructure related to energy generation, suggesting that the village lacks the necessary resources or initiatives to harness renewable energy effectively. Consequently, the community may face challenges in energy access and sustainability, limiting its potential for economic growth and development. This situation highlights the need for targeted interventions to improve energy infrastructure and promote local energy solutions.
