
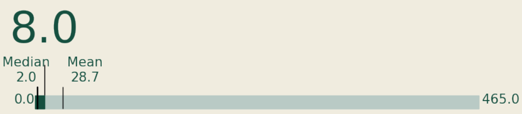
Commezzadura is a picturesque village in Italy, located in the Trentino region. It is known for its stunning natural landscapes, outdoor recreational activities, and rich cultural heritage. The village offers a blend of traditional Alpine architecture and modern amenities, making it a charming destination for visitors and residents alike.

Village Smartness Index

A village smartness index value of 0.02 indicates a low level of smartness in comparison to the overall range observed in the research. With a minimum value of 0.0 and a maximum of 1.0, this index suggests that the village is still in the early stages of adopting smart technologies and practices. The median value of 0.01 and mean value of 0.07 further highlight that while some villages are beginning to implement smart initiatives, this particular village has limited advancements. The low index may reflect insufficient data or a lack of initiatives aimed at enhancing smartness, emphasizing the need for targeted development strategies to improve its status.

Indicator 1.1.1

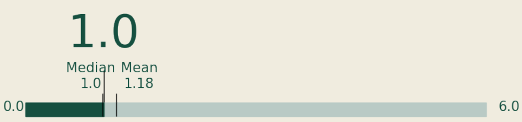
Measures the availability and quality of digital network connections within a rural community.



A smart village index indicator value of 8.0 suggests a relatively low level of digital connectivity within the rural community being assessed. This value indicates that while there are some digital network connections available, they may not be sufficient in quality or coverage to meet the needs of the residents effectively. The presence of a value above zero signifies that there is some level of digital infrastructure, but it is far from optimal, potentially limiting access to essential services and opportunities for economic development. This situation may hinder the community's ability to fully leverage technology for improving quality of life and fostering innovation.

Indicator 1.1.2

Assesses traditional, non-digital means of connectivity (e.g., postal services, telephony) to gauge infrastructure inclusivity in areas with limited digital access.



A calculated smart village index indicator value of 1.0 signifies a community that demonstrates a basic level of connectivity and infrastructure inclusivity, particularly through traditional, non-digital means such as postal services and telephony. This value indicates that while the village has some foundational connectivity, it may still face challenges in fully integrating digital technologies. The presence of a 1.0 score suggests that there are opportunities for improvement in enhancing access to information and services, which could ultimately lead to better quality of life for residents. The low score also highlights the need for further investment in both digital and traditional infrastructure to bridge existing gaps.

Indicator 1.1.4

Examines the affordability and economic accessibility of internet services for rural residents, aiming to highlight potential barriers to digital engagement. [Internet café, libraries]

A calculated smart village index indicator value of 0.0 signifies a significant lack of digital engagement and accessibility in the current

0.0

location. This value suggests that residents face substantial barriers to accessing internet services, which may stem from inadequate infrastructure, limited availability of internet cafes or libraries, and overall economic constraints. The absence of data could also indicate that there are no existing initiatives or resources aimed at improving digital connectivity in this area, further exacerbating the challenges faced by the community. This situation highlights the urgent need for targeted interventions to enhance digital access and promote engagement among rural residents.

Indicator 2.1.1

This indicator measures the extent to which public transport services are available and accessible to rural populations, including frequency, coverage, and proximity of services. It reflects the inclusiveness and usability of the transport network in addressing mobility needs in sparsely populated areas.

0.0

A calculated smart village index indicator value of 0.0 signifies a complete absence of accessible public transport services for the rural population in the current location. This indicates that there are no available transport options, which severely limits mobility and access to essential services for residents. The lack of frequency, coverage, and proximity of transport services reflects a significant gap in the transport network, highlighting the challenges faced by the community in meeting their mobility needs. This situation underscores the urgent need for improvements in transport infrastructure to enhance accessibility and inclusivity for the residents.

Indicator 2.2.2

This indicator assesses the adoption and use of vehicles powered by low-carbon or renewable fuels, such as electric vehicles (EVs), plug-in hybrids, or vehicles running on biodiesel, in rural areas.

2.0

A smart village index indicator value of 2.0 suggests a modest level of adoption and use of vehicles powered by low-carbon or renewable fuels within the assessed rural area. This indicates that while there is some engagement with sustainable transportation options, it is not yet widespread. The presence of electric vehicles, plug-in hybrids, or biodiesel vehicles may be limited, reflecting potential barriers such as infrastructure, awareness, or availability of these technologies. The value signifies an opportunity for growth and improvement in promoting sustainable mobility solutions in the community.

Indicator 3.2.1

Measures the spread of localized energy generation facilities, enhancing local energy resilience.

A calculated smart village index indicator value of 0.0 signifies that the village in question exhibits no measurable progress or development in the context of smart village initiatives, particularly regarding localized energy generation facilities. This zero value may indicate a complete absence of data or infrastructure related to energy resilience, suggesting that the village lacks the necessary resources or initiatives to enhance its energy independence. Consequently, this situation reflects a significant challenge in achieving sustainable energy solutions and highlights the need for targeted interventions to foster local energy resilience and development.
