

Mezzana is a picturesque village located in the Trentino region of Italy, nestled in the Val di Sole valley. Known for its stunning alpine scenery, it offers outdoor activities like skiing and hiking, making it a popular destination for nature lovers and adventure enthusiasts. Enjoy the charm of this quaint village!

Village Smartness Index

A village smartness index value of 0.05 indicates a relatively low level of smartness compared to the maximum possible score of 1.0. This suggests that the village has initiated some smart initiatives but is still in the early stages of development. With a mean value of 0.07 and a median of 0.01 among other villages, this particular village is slightly above the median, indicating a modest engagement with smart technologies and practices. The low index may reflect limited data availability or underdeveloped smart services, highlighting opportunities for growth and improvement in areas such as governance, mobility, and community engagement. Overall, this value suggests a need for further investment and strategic planning to enhance the village's smartness capabilities.

Indicator 1.1.1

Measures the availability and quality of digital network connections within a rural community.

18.0

The calculated smart village index indicator value of 18.0 suggests a moderate level of availability and quality of digital network connections within the rural community in question. This value indicates that while there is some degree of digital connectivity, it is not yet robust or comprehensive. The presence of a value significantly higher than the minimum of 0.0 implies that there are at least some digital resources or infrastructure in place, but the community may still face challenges in fully leveraging these technologies for enhanced economic and social development. Overall, this index value reflects an opportunity for growth and improvement in digital connectivity within the village.

Indicator 1.1.2

Assesses traditional, non-digital means of connectivity (e.g., postal services, telephony) to gauge infrastructure inclusivity in areas with limited digital access.

4.0

A smart village index indicator value of 4.0 signifies a relatively advanced level of smartness in the assessed village, indicating that it has effectively integrated various digital technologies and innovative solutions to enhance its infrastructure and services. This value suggests that the village has made significant strides in areas such as connectivity, economic opportunities, and community engagement. The presence of robust digital infrastructure likely supports better access to essential services, improving the overall quality of life for residents. In contrast to other villages in the research, which exhibit lower levels of digital integration, this village stands out as a model for leveraging technology to foster sustainable development and inclusivity.

Indicator 1.1.4

Examines the affordability and economic accessibility of internet services for rural residents, aiming to highlight potential barriers to digital engagement. [Internet café, libraries]

A calculated smart village index indicator value of 1.0 signifies a

moderate level of smartness in the village, indicating that it has implemented some digital technologies and services, but there is still significant room for improvement. This value suggests that while there are efforts to enhance connectivity and digital engagement, challenges remain, particularly in terms of affordability and economic accessibility of internet services for rural residents. Barriers such as limited access to internet cafés and libraries may hinder broader digital participation, reflecting the need for targeted initiatives to improve infrastructure and reduce costs for residents.

Indicator 2.1.1

This indicator measures the extent to which public transport services are available and accessible to rural populations, including frequency, coverage, and proximity of services. It reflects the inclusiveness and usability of the transport network in addressing mobility needs in sparsely populated areas.

A calculated smart village index indicator value of 1.0 signifies a modest level of public transport services available and accessible to the rural population in the specific village. This value indicates that while there are some transport services present, they may not be fully meeting the mobility needs of residents. The frequency, coverage, and proximity of these services are likely limited, suggesting that improvements are necessary to enhance inclusiveness and usability for the community. This situation highlights the ongoing challenges faced by rural areas in achieving effective mobility solutions.

Indicator 2.2.2

This indicator assesses the adoption and use of vehicles powered by low-carbon or renewable fuels, such as electric vehicles (EVs), plug-in hybrids, or vehicles running on biodiesel, in rural areas.

A smart village index indicator value of 1.0 signifies a modest level of adoption and use of vehicles powered by low-carbon or renewable fuels within the assessed rural area. This value indicates that while there is some engagement with sustainable transportation options, it remains limited compared to the potential for growth. The presence of electric vehicles or other low-carbon alternatives may be minimal, reflecting early stages of transition towards greener mobility solutions. This suggests opportunities for further development and investment in sustainable transport infrastructure and awareness initiatives to enhance the village's environmental sustainability.

Indicator 3.2.1

Measures the spread of localized energy generation facilities, enhancing local energy resilience.

The calculated smart village index indicator value of 0.0 signifies a complete absence of localized energy generation facilities within the village, indicating a critical gap in energy resilience. This zero value suggests that the village lacks the necessary infrastructure or initiatives to harness renewable energy sources, which are essential for enhancing local energy security and sustainability. The absence of data may further exacerbate this situation, highlighting the need for improved data collection and analysis to inform future energy strategies and development initiatives in the area. Addressing this deficiency is crucial for fostering economic opportunities and improving the quality of life for residents.
