

Peio is a picturesque village located in the Trentino region of Italy, nestled in the Val di Peio valley. Known for its stunning alpine scenery, it offers outdoor activities like skiing and hiking, along with rich cultural heritage and thermal springs that attract visitors seeking relaxation and wellness.

Village Smartness Index

A village smartness index value of 0.03 indicates a low level of smartness within the community, suggesting that while some initiatives may be in place, they are not yet fully developed or widely implemented. This value is slightly above the median of 0.01 and below the mean of 0.07, indicating that the village is in the early stages of smart transformation. The presence of a value above zero suggests some awareness or efforts towards innovation, but significant room for improvement remains. The index reflects the need for enhanced data collection and stakeholder engagement to foster a more robust smart village framework.

Indicator 1.1.1

Measures the availability and quality of digital network connections within a rural community.

10.0

A smart village index indicator value of 10.0 suggests a moderate level of availability and quality of digital network connections within the rural community. This value indicates that while there is some degree of connectivity, it is not yet robust or comprehensive. The presence of digital infrastructure is essential for enabling access to information, services, and economic opportunities. A score of 10.0 reflects ongoing efforts to improve connectivity, but there remains significant room for enhancement to fully support the community's digital needs and aspirations. Overall, this value highlights the importance of continued investment in digital infrastructure to foster sustainable development in the village.

Indicator 1.1.2

Assesses traditional, non-digital means of connectivity (e.g., postal services, telephony) to gauge infrastructure inclusivity in areas with limited digital access.

2.0

A smart village index indicator value of 2.0 suggests a moderate level of smartness in the village's infrastructure and services. This value indicates that while the village has made some progress in adopting innovative solutions and technologies, it still lags behind the maximum potential of 6.0. The assessment focuses on traditional connectivity methods, such as postal services and telephony, highlighting the village's efforts to maintain inclusivity in areas with limited digital access. The presence of a value above the median of 1.0 indicates a recognition of the importance of connectivity, even if digital infrastructure remains underdeveloped. Overall, this score reflects a commitment to improving local services and enhancing community resilience.

Indicator 1.1.4

Examines the affordability and economic accessibility of internet services for rural residents, aiming to highlight potential barriers to digital engagement. [Internet café, libraries]

A calculated smart village index indicator value of 1.0 signifies a moderate level of smartness in the village, indicating that it has

implemented some digital technologies and services, but there is still significant room for improvement. This value suggests that while certain aspects of digital engagement are present, such as access to internet services through facilities like internet cafés or libraries, barriers still exist that may hinder broader digital participation among residents. The presence of a value above the minimum indicates a recognition of the importance of digital connectivity, yet challenges related to affordability and accessibility remain critical to address for enhancing overall digital engagement in the community.

Indicator 2.1.1

This indicator measures the extent to which public transport services are available and accessible to rural populations, including frequency, coverage, and proximity of services. It reflects the inclusiveness and usability of the transport network in addressing mobility needs in sparsely populated areas.

A calculated smart village index indicator value of 0.0 signifies a critical absence of public transport services in the area, indicating that residents face significant barriers to mobility. This value suggests that there may be no available public transport options, or that existing services are infrequent, poorly covered, or inaccessible to the rural population. Such a situation severely limits residents' ability to access essential services, work, and social opportunities, highlighting a pressing need for improved transport infrastructure and services to enhance mobility and inclusivity in the community.

Indicator 2.2.2

This indicator assesses the adoption and use of vehicles powered by low-carbon or renewable fuels, such as electric vehicles (EVs), plug-in hybrids, or vehicles running on biodiesel, in rural areas.

A smart village index indicator value of 3.0 suggests a moderate level of adoption and use of low-carbon or renewable fuel vehicles in the assessed rural area. This indicates that while there is some engagement with sustainable transportation options, it is not yet widespread. The presence of electric vehicles or other alternative fuel vehicles may be limited, reflecting potential barriers such as infrastructure, awareness, or availability. This value highlights an opportunity for growth in promoting sustainable mobility solutions within the community, aligning with broader environmental goals.

Indicator 3.2.1

Measures the spread of localized energy generation facilities, enhancing local energy resilience.

The calculated smart village index indicator value of 0.0 signifies a complete absence of localized energy generation facilities within the village, indicating a critical gap in energy resilience. This zero value suggests that the village lacks the necessary infrastructure or initiatives to harness renewable energy sources, which are essential for enhancing local energy security and sustainability. The absence of data may reflect insufficient investment, lack of awareness, or challenges in implementing smart energy solutions, ultimately hindering the village's potential for economic and social development. Addressing these issues is vital for fostering a more resilient and sustainable community.
