

A village Rabbi in IT serves as a local coordinator, bridging technology and community needs. They facilitate digital connectivity, promote smart solutions, and support residents in leveraging technology for sustainable development, enhancing quality of life and economic opportunities in rural areas. Their role is crucial for community-driven initiatives.

Village Smartness Index

A village smartness index value of 0.06 indicates a relatively low level of smartness compared to the maximum value of 1.0 in the research. This score suggests that the village has initiated some activities or services aimed at innovation and smart transformation, but it is still in the early stages of development. The proximity of this value to the mean of 0.07 indicates that the village is slightly below average in terms of smartness. Factors contributing to this score may include limited access to technology, insufficient infrastructure, or a lack of community engagement in smart initiatives. Overall, while there are some efforts underway, significant improvements are needed to enhance the village's smartness and overall quality of life.

Indicator 1.1.1

Measures the availability and quality of digital network connections within a rural community.

24.0

The calculated smart village index indicator value of 24.0 suggests a moderate level of availability and quality of digital network connections within the rural community in question. This value indicates that while there are some digital resources and connectivity options present, they may not be fully optimized or widely accessible to all residents. The presence of a value above zero signifies that there is some level of digital infrastructure, but it also highlights the need for further improvements to enhance connectivity and overall digital engagement within the community. This situation presents an opportunity for targeted interventions to boost digital access and quality, ultimately contributing to the community's development and integration into the broader digital economy.

Indicator 1.1.2

Assesses traditional, non-digital means of connectivity (e.g., postal services, telephony) to gauge infrastructure inclusivity in areas with limited digital access.

3.0

A smart village index indicator value of 3.0 suggests a moderate level of smartness in the village's infrastructure and services. This value indicates that the village has implemented several innovative solutions and technologies, but there is still room for improvement. The assessment focuses on traditional, non-digital means of connectivity, such as postal services and telephony, which are crucial for inclusivity, especially in areas with limited digital access. A score of 3.0 reflects a balanced approach to connectivity, indicating that while some digital initiatives may be present, traditional methods remain significant in supporting the community's needs. This level of smartness can enhance local economic opportunities and improve overall quality of life.

Indicator 1.1.4

Examines the affordability and economic accessibility of internet services for rural residents, aiming to highlight potential barriers to digital engagement. [Internet café, libraries]

Indicator 2.1.1

This indicator measures the extent to which public transport services are available and accessible to rural populations, including frequency, coverage, and proximity of services. It reflects the inclusiveness and usability of the transport network in addressing mobility needs in sparsely populated areas.

Indicator 2.2.2

This indicator assesses the adoption and use of vehicles powered by low-carbon or renewable fuels, such as electric vehicles (EVs), plug-in hybrids, or vehicles running on biodiesel, in rural areas.

Indicator 3.2.1

Measures the spread of localized energy generation facilities, enhancing local energy resilience.

A calculated smart village index indicator value of 0.0 signifies that the village in question exhibits no measurable progress or implementation of smart village initiatives. This could indicate a complete absence of digital infrastructure, services, or engagement strategies that are typically associated with smart village development. The lack of data may reflect insufficient access to internet services, economic barriers, or a lack of community initiatives aimed at enhancing digital connectivity. Consequently, residents may face significant challenges in accessing online resources, which can hinder their participation in the digital economy and limit opportunities for social and economic advancement.

A calculated smart village index indicator value of 0.0 signifies a complete absence of public transport services available and accessible to the rural population in the assessed area. This indicates that there are no transport options in terms of frequency, coverage, or proximity, severely limiting mobility for residents. Such a scenario reflects significant challenges in inclusiveness and usability of the transport network, which is crucial for connecting individuals to essential services, employment, and social opportunities in sparsely populated regions.

A smart village index indicator value of 2.0 suggests a low level of adoption and use of vehicles powered by low-carbon or renewable fuels in the assessed rural area. This indicates that while there may be some presence of electric vehicles or other sustainable transport options, they are not widely utilized or integrated into the community's transportation system. The value reflects potential challenges such as limited infrastructure for charging stations, lack of awareness, or insufficient incentives for residents to transition to greener vehicle options. Overall, this score highlights the need for targeted initiatives to promote sustainable mobility solutions in the village.

A calculated smart village index indicator value of 0.0 signifies that there is no measurable presence of localized energy generation facilities within the village, which directly impacts local energy resilience. This zero value may indicate a complete absence of renewable energy initiatives or infrastructure, suggesting that the village lacks the necessary data to assess its energy capabilities. Consequently, the community may face challenges in energy access and sustainability, limiting opportunities for economic growth and development. The absence of localized energy solutions can hinder the village's ability to harness renewable resources effectively.
