

Vermiglio is a picturesque village located in the Trentino region of Italy, nestled in the Val di Sole valley. Known for its stunning alpine scenery, it offers outdoor activities like skiing and hiking, and is rich in cultural heritage, showcasing traditional architecture and local craftsmanship. A charming destination for nature lovers!

Village Smartness Index

A village smartness index value of 0.03 indicates a low level of smartness within the context of the research. This score suggests that the village has initiated some activities or services aimed at innovation and smart transformation, but these efforts are still in the early stages. With a median value of 0.01 and a mean of 0.07 among other villages, this index reflects a need for further development and investment in smart services and infrastructure. The presence of a score above zero indicates some awareness and potential for growth, but significant improvements are necessary to enhance the village's overall smartness and align it with more advanced counterparts.

Indicator 1.1.1

Measures the availability and quality of digital network connections within a rural community.

11.0

A smart village index indicator value of 11.0 suggests a moderate level of availability and quality of digital network connections within the rural community. This value indicates that while there is some access to digital infrastructure, it is not yet robust or comprehensive. The presence of a score above zero implies that the community has made strides towards digital connectivity, but significant improvements are still needed to enhance the overall quality of life and economic opportunities for residents. This level of connectivity can support basic digital services, but further investment and development are essential to fully realize the potential benefits of a smart village.

Indicator 1.1.2

Assesses traditional, non-digital means of connectivity (e.g., postal services, telephony) to gauge infrastructure inclusivity in areas with limited digital access.

1.0

A calculated smart village index indicator value of 1.0 signifies a moderate level of development in terms of smart village characteristics, particularly in assessing traditional connectivity methods. This value indicates that the village has some basic infrastructure in place, such as postal services and telephony, which are essential for maintaining communication and access to information. However, it also suggests that there may be significant gaps in digital connectivity and other advanced services, reflecting the challenges faced by rural areas with limited access to modern technologies. The presence of a value of 1.0 highlights the need for further investment and development to enhance the overall quality of life and economic opportunities for the community.

Indicator 1.1.4

Examines the affordability and economic accessibility of internet services for rural residents, aiming to highlight potential barriers to digital engagement. [Internet café, libraries]

A calculated smart village index indicator value of 1.0 signifies a moderate level of smartness in the village, indicating that it has implemented some digital technologies and services, but there is still

significant room for improvement. This value suggests that while there are efforts to enhance connectivity and digital engagement, challenges remain, particularly in terms of affordability and accessibility of internet services for rural residents. Barriers such as limited access to internet cafés or libraries may hinder broader digital participation, reflecting the need for targeted initiatives to improve infrastructure and reduce costs for residents.

Indicator 2.1.1

This indicator measures the extent to which public transport services are available and accessible to rural populations, including frequency, coverage, and proximity of services. It reflects the inclusiveness and usability of the transport network in addressing mobility needs in sparsely populated areas.

A calculated smart village index indicator value of 0.0 signifies a complete absence of public transport services available and accessible to the rural population in the assessed area. This indicates that there are no transport options in terms of frequency, coverage, or proximity, severely limiting mobility for residents. Such a scenario can hinder access to essential services, employment, and social participation, ultimately affecting the overall quality of life in the community. The lack of data may also contribute to this zero value, highlighting the need for improved data collection and analysis in the region.

Indicator 2.2.2

This indicator assesses the adoption and use of vehicles powered by low-carbon or renewable fuels, such as electric vehicles (EVs), plug-in hybrids, or vehicles running on biodiesel, in rural areas.

A smart village index indicator value of 4.0 signifies a moderate level of adoption and use of vehicles powered by low-carbon or renewable fuels in the assessed rural area. This value indicates that while there is some engagement with sustainable transportation options, it is still below the average observed in the broader research context. The presence of electric vehicles, plug-in hybrids, or biodiesel vehicles suggests a growing awareness and potential for further development in sustainable mobility practices within the community. This level of adoption reflects an opportunity for improvement and investment in infrastructure to support greener transportation solutions.

Indicator 3.2.1

Measures the spread of localized energy generation facilities, enhancing local energy resilience.

The calculated smart village index indicator value of 0.0 signifies a complete absence of localized energy generation facilities within the village. This indicates that there are no renewable energy sources or systems in place to enhance local energy resilience. Such a scenario may reflect a lack of investment in energy infrastructure, insufficient data collection, or limited access to technology and resources necessary for establishing energy generation facilities. Consequently, the village may face challenges in achieving energy independence and sustainability, impacting overall community development and quality of life.
