

Fornalutx is a picturesque village located in the Tramuntana mountains of Mallorca, Spain. Known for its charming stone houses, narrow streets, and stunning views, it offers a tranquil atmosphere surrounded by lush greenery and citrus groves, making it a popular destination for tourists seeking natural beauty and cultural heritage.

Village Smartness Index

A village smartness index value of 0.01 indicates a very low level of smartness in comparison to other villages in the research. This score suggests that the village has minimal initiatives or infrastructure in place to support smart development, reflecting a lack of innovation and sustainable practices. The median value of 0.01 indicates that this village is at the lower end of the spectrum, highlighting potential challenges in areas such as mobility, governance, and economy. The low index may also point to insufficient data collection or engagement from the community, which could hinder progress towards becoming a smarter village. Overall, this value underscores the need for targeted interventions to enhance the village's smartness and improve the quality of life for its residents.

Indicator 1.1.1

Measures the availability and quality of digital network connections within a rural community.

A calculated smart village index indicator value of 1.0 suggests that the rural community has a very basic level of digital network connectivity. This low value indicates that while there may be some form of digital infrastructure present, it is likely insufficient to meet the needs of the community effectively. The limited connectivity could hinder access to essential services such as telemedicine, online education, and digital business opportunities. Consequently, residents may face challenges in fully leveraging technology for improving their quality of life and economic prospects. Enhancing digital connectivity in this village could significantly impact its overall development and integration into the broader digital economy.

Indicator 1.1.2

Assesses traditional, non-digital means of connectivity (e.g., postal services, telephony) to gauge infrastructure inclusivity in areas with limited digital access.

A calculated smart village index indicator value of 1.0 suggests a baseline level of connectivity and infrastructure inclusivity in the current location. This value indicates that while there are some traditional, non-digital means of connectivity, such as postal services and telephony, the overall infrastructure may still be limited. The presence of a value of 1.0 reflects a community that has made some progress in connectivity, but significant gaps remain, particularly in digital access. This situation may hinder the community's ability to fully leverage technological advancements for economic and social development.

Indicator 1.1.4

Examines the affordability and economic accessibility of internet services for rural residents, aiming to highlight potential barriers to digital engagement. [Internet café, libraries]

A calculated smart village index indicator value of 0.0 signifies a

Indicator 2.1.1

This indicator measures the extent to which public transport services are available and accessible to rural populations, including frequency, coverage, and proximity of services. It reflects the inclusiveness and usability of the transport network in addressing mobility needs in sparsely populated areas.

Indicator 2.2.2

This indicator assesses the adoption and use of vehicles powered by low-carbon or renewable fuels, such as electric vehicles (EVs), plug-in hybrids, or vehicles running on biodiesel, in rural areas.

Indicator 3.2.1

Measures the spread of localized energy generation facilities, enhancing local energy resilience.

significant lack of digital engagement and accessibility in the current location. This value suggests that there are substantial barriers preventing rural residents from accessing affordable internet services, which may include limited infrastructure, high costs, or insufficient availability of internet cafes and libraries. The absence of data could also indicate a lack of initiatives or resources aimed at improving digital connectivity in the area, further exacerbating the challenges faced by the community in engaging with digital technologies. This situation highlights the urgent need for targeted interventions to enhance digital inclusion and support sustainable development in rural areas.

A calculated smart village index indicator value of 0.0 signifies a complete absence of accessible public transport services for the rural population in the current location. This indicates that there are no available transport options, which severely limits mobility and access to essential services for residents. The lack of frequency, coverage, and proximity of transport services reflects a significant gap in the transport network, highlighting the challenges faced by the community in meeting their mobility needs. This situation underscores the urgent need for improvements in transport infrastructure to enhance accessibility and inclusivity for the residents.

A smart village index indicator value of 2.0 suggests a modest level of adoption and use of low-carbon or renewable fuel vehicles in the assessed rural area. This value indicates that while there is some engagement with sustainable transportation options, it is not yet widespread. The presence of electric vehicles, plug-in hybrids, or biodiesel vehicles may be limited, reflecting potential barriers such as infrastructure, awareness, or availability of these technologies. The index highlights an opportunity for growth in sustainable mobility solutions within the community.

A calculated smart village index indicator value of 0.0 signifies that the village lacks any measurable progress or implementation of localized energy generation facilities, which are crucial for enhancing local energy resilience. This zero value may indicate a complete absence of data or initiatives related to energy generation within the community. Consequently, the village may be facing significant challenges in energy access and sustainability, limiting its potential for development and integration into broader smart village frameworks. The lack of localized energy solutions can hinder economic growth and community well-being.
