

Kalajoki is a picturesque village in Finland known for its beautiful sandy beaches along the Gulf of Bothnia. It features a vibrant community, rich cultural heritage, and outdoor activities, making it a popular destination for both locals and tourists seeking nature and relaxation. Enjoy the stunning landscapes and local charm!

Village Smartness Index

A village smartness index value of 0.58 indicates a relatively moderate level of smartness compared to the overall range observed in the research. With a minimum value of 0.0 and a maximum of 1.0, this score suggests that the village has implemented some effective smart initiatives, but there is still significant room for improvement. The index reflects various dimensions such as mobility, governance, and economy, indicating that while the village has made strides in certain areas, challenges remain in fully realizing its smart potential. This score positions the village above the median and mean values, highlighting its potential for further development and innovation.

Indicator 1.1.1

Measures the availability and quality of digital network connections within a rural community.

The calculated smart village index indicator value of 263.0 signifies a relatively strong presence of digital network connections within the rural community being assessed. This value suggests that the village has made significant strides in enhancing its digital infrastructure, which is crucial for facilitating access to information, services, and economic opportunities. A score of 263.0 indicates that the community likely benefits from reliable internet connectivity, enabling residents to engage in online education, telemedicine, and digital entrepreneurship, thereby improving their overall quality of life. This level of connectivity can foster innovation and support local development initiatives, positioning the village favorably in the context of smart village frameworks.

Indicator 1.1.2

Assesses traditional, non-digital means of connectivity (e.g., postal services, telephony) to gauge infrastructure inclusivity in areas with limited digital access.

A smart village index indicator value of 2.0 suggests a moderate level of connectivity and infrastructure inclusivity in the assessed village. This value indicates that while there are some traditional, non-digital means of connectivity, such as postal services and telephony, the overall infrastructure may still be lacking compared to more digitally advanced areas. The presence of a value above the median of 1.0 reflects a recognition of existing resources, but it also highlights the need for further development to enhance connectivity and access for residents, especially in areas with limited digital infrastructure. This situation emphasizes the importance of bridging the gap between traditional and digital means to improve the quality of life in rural communities.

Indicator 1.1.4

Examines the affordability and economic accessibility of internet services for rural residents, aiming to highlight potential barriers to digital engagement. [Internet café, libraries]

A calculated smart village index indicator value of 2.0 signifies a relatively high level of digital engagement and accessibility in the

context of internet services for rural residents. This value suggests that the village has made significant strides in providing affordable and accessible internet options, such as internet cafés and libraries, which can facilitate digital engagement among the community. The presence of these services indicates a commitment to bridging the digital divide, enhancing opportunities for education, communication, and economic development. However, it is essential to recognize that this value is at the upper limit of the scale, reflecting a unique situation compared to other villages in the research, where many face substantial barriers to digital access.

Indicator 2.1.1

This indicator measures the extent to which public transport services are available and accessible to rural populations, including frequency, coverage, and proximity of services. It reflects the inclusiveness and usability of the transport network in addressing mobility needs in sparsely populated areas.

A calculated smart village index indicator value of 1.0 signifies a modest level of public transport service availability and accessibility for the rural population in the current location. This value indicates that while there are some transport services present, they may not be frequent or comprehensive enough to fully meet the mobility needs of residents. The transport network's inclusiveness and usability are limited, suggesting that improvements are necessary to enhance connectivity and accessibility for the community. This situation highlights the ongoing challenges faced by rural areas in achieving effective transportation solutions.

Indicator 2.2.2

This indicator assesses the adoption and use of vehicles powered by low-carbon or renewable fuels, such as electric vehicles (EVs), plug-in hybrids, or vehicles running on biodiesel, in rural areas.

The calculated smart village index indicator value of 19.0 signifies a strong commitment to adopting low-carbon and renewable fuel vehicles within this specific rural community. This high value indicates that the village has successfully integrated electric vehicles, plug-in hybrids, or biodiesel-powered vehicles into its transportation system, reflecting a proactive approach to sustainability and environmental responsibility. Such adoption not only reduces greenhouse gas emissions but also enhances energy independence and promotes cleaner air quality, contributing positively to the overall quality of life for residents. This indicator showcases the village's leadership in sustainable mobility practices, setting a benchmark for others in the region.

Indicator 3.2.1

Measures the spread of localized energy generation facilities, enhancing local energy resilience.

A calculated smart village index indicator value of 0.0 signifies that the village in question exhibits no measurable progress or development in the context of smart village initiatives, particularly regarding localized energy generation facilities. This zero value may indicate a complete absence of data or resources related to energy resilience, suggesting that the village lacks the necessary infrastructure or initiatives to support sustainable energy practices. Consequently, the community may face challenges in energy access and resilience, limiting its potential for growth and development. This situation underscores the need for targeted interventions to enhance local energy systems and improve overall community sustainability.
