Village Smartness Index

A village smartness index value of 0.0 indicates that the village has not yet implemented any measurable smart initiatives or technologies that contribute to its development. This could be attributed to a lack of data, resources, or strategic planning for smart village initiatives. Such a low index suggests that the village may be facing significant challenges in areas such as governance, economy, and infrastructure, which are essential for fostering innovation and improving the quality of life for its residents. Without any smart solutions in place, the village may struggle to attract investment or enhance its services, ultimately hindering its growth and resilience.

Indicator 1.1.1

Measures the availability and quality of digital network connections within a rural community.

A calculated smart village index indicator value of 0.0 signifies that the specific rural community lacks any measurable availability or quality of digital network connections. This absence may indicate a significant digital divide, where residents are unable to access essential online services, information, or communication tools. Such a low index value could stem from inadequate infrastructure, limited investment in technology, or insufficient data collection efforts. Consequently, this community may face challenges in leveraging digital innovations to enhance their quality of life and economic opportunities.

Indicator 1.1.2

Assesses traditional, non-digital means of connectivity (e.g., postal services, telephony) to gauge infrastructure inclusivity in areas with limited digital access.

A calculated smart village index indicator value of 0.0 signifies a complete absence of assessed connectivity and infrastructure inclusivity in the current location. This could indicate a lack of traditional, non-digital means of connectivity, such as postal services or telephony, which are essential for fostering communication and access to resources in areas with limited digital access. The zero value may also reflect insufficient data collection or reporting, highlighting a critical gap in understanding the community's connectivity landscape. This situation underscores the need for targeted interventions to enhance infrastructure and improve overall inclusivity.

Indicator 1.1.4

Examines the affordability and economic accessibility of internet services for rural residents, aiming to highlight potential barriers to digital engagement. [Internet café, libraries]

A calculated smart village index indicator value of 0.0 signifies a complete absence of the necessary components or conditions that

contribute to the development of a smart village. This could indicate a lack of digital infrastructure, such as internet connectivity, or insufficient access to services that facilitate digital engagement, like internet cafés or libraries. The zero value may also reflect a lack of data collection or reporting in the area, highlighting significant barriers to economic accessibility and affordability of internet services for rural residents. This situation underscores the urgent need for targeted interventions to enhance digital engagement and improve overall quality of life in the community.

Indicator 2.1.1

This indicator measures the extent to which public transport services are available and accessible to rural populations, including frequency, coverage, and proximity of services. It reflects the inclusiveness and usability of the transport network in addressing mobility needs in sparsely populated areas.

A calculated smart village index indicator value of 0.0 signifies a complete absence of public transport services available and accessible to the rural population in the area. This indicates that there are no transport options in terms of frequency, coverage, or proximity, severely limiting mobility for residents. Such a scenario reflects significant challenges in inclusiveness and usability of the transport network, which is crucial for connecting individuals to essential services, employment, and social opportunities in sparsely populated regions.

Indicator 2.2.2

This indicator assesses the adoption and use of vehicles powered by low-carbon or renewable fuels, such as electric vehicles (EVs), plug-in hybrids, or vehicles running on biodiesel, in rural areas.

A smart village index indicator value of 0.0 signifies that there is no recorded adoption or use of vehicles powered by low-carbon or renewable fuels in the assessed area. This could indicate a lack of infrastructure, such as charging stations for electric vehicles, or limited awareness and availability of such vehicles among the residents. Additionally, it may reflect insufficient data collection efforts in the region, leading to an absence of measurable activity in promoting sustainable transportation options. This situation highlights potential areas for development and investment to enhance mobility and environmental sustainability in the community.

Indicator 3.2.1

Measures the spread of localized energy generation facilities, enhancing local energy resilience.

The calculated smart village index indicator value of 0.0 signifies a complete absence of localized energy generation facilities within the village, indicating a critical gap in energy resilience. This zero value suggests that the village lacks the necessary infrastructure or initiatives to harness renewable energy sources, which are essential for enhancing local energy security and sustainability. The absence of data may further exacerbate this situation, highlighting the need for comprehensive assessments and interventions to promote energy generation and improve the overall quality of life in the community. Addressing these deficiencies is vital for fostering a more resilient and sustainable environment.
