

Dimaro Folgarida is a picturesque village in Trentino, Italy, nestled in the Val di Sole valley. Known for its stunning alpine scenery, it offers outdoor activities like skiing and hiking, along with rich cultural heritage and local cuisine, making it a charming destination for nature lovers and tourists.

## Village Smartness Index

A village smartness index value of 0.06 indicates a relatively low level of smartness compared to the maximum value of 1.0 in the research. This score suggests that the village has initiated some activities or services aimed at innovation and smart transformation, but it is still in the early stages of development. With a mean value of 0.07 and a median of 0.01, this village is slightly above average, indicating potential for growth. The low index may reflect limited resources or data availability, which could hinder further advancements in smart initiatives. Overall, while there are some efforts underway, significant improvements are needed to enhance the village's smartness.

### Indicator 1.1.1

Measures the availability and quality of digital network connections within a rural community.

17.0

The calculated smart village index indicator value of 17.0 suggests a moderate level of availability and quality of digital network connections within the rural community in question. This value indicates that while there are some digital resources and connectivity options present, they may not be fully developed or widely accessible to all residents. The presence of a value significantly above the minimum of 0.0 indicates that there are efforts in place to enhance digital infrastructure, but there remains considerable room for improvement to reach optimal connectivity levels that can support various community needs and initiatives. Overall, this score reflects a community that is on the path toward better digital integration, yet still faces challenges in achieving comprehensive connectivity.

### Indicator 1.1.2

Assesses traditional, non-digital means of connectivity (e.g., postal services, telephony) to gauge infrastructure inclusivity in areas with limited digital access.

A smart village index indicator value of 6.0 signifies a high level of smartness and technological integration within the village, indicating that it has effectively implemented various digital solutions and innovations to enhance the quality of life for its residents. This value reflects robust infrastructure, including advanced connectivity options, renewable energy sources, and smart agricultural practices. In contrast to other villages in the research, which have lower index values, this village demonstrates a commitment to leveraging technology for sustainable development and improved local governance, showcasing its potential as a model for rural advancement.

### Indicator 1.1.4

Examines the affordability and economic accessibility of internet services for rural residents, aiming to highlight potential barriers to digital engagement. [Internet café, libraries]

A calculated smart village index indicator value of 1.0 signifies a moderate level of smartness in the village, indicating that it has

implemented some digital technologies and services that enhance the quality of life for its residents. This value suggests that while there are advancements in connectivity and access to information, there are still significant gaps compared to the maximum potential of 2.0. The presence of internet cafés and libraries may provide some access points for digital engagement, but barriers such as affordability and economic accessibility remain critical challenges for rural residents. The zero values observed in other villages may reflect a lack of data or insufficient digital infrastructure, highlighting the need for targeted interventions to improve connectivity and engagement in those areas.

### Indicator 2.1.1

A calculated smart village index indicator value of 1.0 signifies a modest level of public transport services available and accessible to the rural population in the current location. This value indicates that while there are some transport services present, they may not be sufficiently frequent, comprehensive, or close enough to meet the mobility needs of residents effectively. The indicator reflects a starting point for improvement, highlighting the need for enhanced transport solutions to foster greater inclusivity and usability in addressing the mobility challenges faced by the community.

### Indicator 2.2.2

A smart village index indicator value of 3.0 suggests a moderate level of adoption and use of low-carbon or renewable fuel vehicles in the current location. This indicates that while there is some engagement with sustainable transportation options, it is not yet widespread. The presence of electric vehicles or other alternative fuel vehicles may be limited, reflecting a nascent stage in the transition towards greener mobility solutions. This value highlights the potential for growth and improvement in promoting sustainable transport initiatives within the community. Overall, it signifies an opportunity for further development in the adoption of eco-friendly vehicles to enhance environmental sustainability in the area.

### Indicator 3.2.1

The calculated smart village index indicator value of 0.0 signifies a complete absence of localized energy generation facilities within the assessed area. This indicates that the village lacks any form of renewable energy infrastructure, which is crucial for enhancing local energy resilience. Such a zero value may stem from insufficient data or a lack of investment in energy initiatives. Consequently, the community may face challenges in energy access and sustainability, limiting its potential for economic growth and development. This situation underscores the need for targeted interventions to foster energy generation capabilities in the village.
