

Ossana is a picturesque village located in the Trentino region of Italy, nestled in the Val di Sole valley. Known for its stunning alpine scenery, it offers rich cultural heritage, outdoor activities, and a charming atmosphere, making it a delightful destination for nature lovers and tourists alike.

Village Smartness Index

A village smartness index value of 0.02 indicates a very low level of smartness within that community. This suggests that the village is in the early stages of adopting smart technologies and practices, with limited initiatives focused on innovation and digital transformation. The index reflects a lack of comprehensive data, which may hinder the village's ability to assess its needs and opportunities effectively. Consequently, this low score highlights the necessity for targeted strategies to enhance smartness and foster sustainable development within the village.

Indicator 1.1.1

Measures the availability and quality of digital network connections within a rural community.

5.0

A calculated smart village index indicator value of 5.0 signifies a relatively low level of digital connectivity within the rural community, especially when compared to the maximum value of 465.0 observed in other villages. This indicates that while there is some availability of digital network connections, it is insufficient to meet the needs of the community effectively. The low score suggests potential challenges in accessing online services, educational resources, and economic opportunities, which are crucial for enhancing the quality of life and fostering sustainable development in the area. The presence of a value above zero indicates that there are some digital resources available, but significant improvements are necessary to bridge the digital divide and fully leverage technology for community advancement.

Indicator 1.1.2

Assesses traditional, non-digital means of connectivity (e.g., postal services, telephony) to gauge infrastructure inclusivity in areas with limited digital access.

1.0

A calculated smart village index indicator value of 1.0 signifies a moderate level of development in terms of smart village characteristics, particularly in assessing traditional connectivity methods. This value indicates that the village has some basic infrastructure in place, such as postal services and telephony, which are essential for communication and access to information. However, it also suggests that there may be significant gaps in digital connectivity and inclusivity, reflecting challenges in fully integrating modern technologies. The presence of a zero value in other villages may indicate a complete lack of data or infrastructure, highlighting the need for further development and investment in these areas to enhance overall connectivity and quality of life.

Indicator 1.1.4

Examines the affordability and economic accessibility of internet services for rural residents, aiming to highlight potential barriers to digital engagement. [Internet café, libraries]

A calculated smart village index indicator value of 1.0 signifies a

Indicator 2.1.1

This indicator measures the extent to which public transport services are available and accessible to rural populations, including frequency, coverage, and proximity of services. It reflects the inclusiveness and usability of the transport network in addressing mobility needs in sparsely populated areas.

Indicator 2.2.2

This indicator assesses the adoption and use of vehicles powered by low-carbon or renewable fuels, such as electric vehicles (EVs), plug-in hybrids, or vehicles running on biodiesel, in rural areas.

Indicator 3.2.1

Measures the spread of localized energy generation facilities, enhancing local energy resilience.

moderate level of smartness in the village, indicating that it has implemented some digital technologies and innovative solutions to enhance local services and governance. This value suggests that while the village is making strides towards digital engagement, there are still significant gaps compared to the maximum potential of 2.0. The presence of internet cafés and libraries may provide some access to digital services, but affordability and economic accessibility remain critical barriers for many rural residents, potentially limiting their full participation in the digital economy. The zero values observed in other villages could reflect a lack of data or minimal digital infrastructure, underscoring the need for targeted interventions to improve connectivity and access.

A calculated smart village index indicator value of 1.0 signifies a modest level of public transport services available and accessible to the rural population in the specific village. This value indicates that while there are some transport services present, they may not be sufficient to fully meet the mobility needs of residents. The frequency, coverage, and proximity of these services are likely limited, reflecting challenges in inclusiveness and usability for the community. This situation highlights the ongoing need for improvements in the transport network to enhance accessibility for all residents.

A smart village index indicator value of 5.0 signifies a moderate level of adoption and use of vehicles powered by low-carbon or renewable fuels in the assessed rural area. This value indicates that while there is some engagement with sustainable transportation options, it is still below the average observed in the broader research context. The presence of electric vehicles, plug-in hybrids, or biodiesel vehicles suggests a growing awareness and potential for further development in sustainable mobility solutions within the community. This moderate score reflects an opportunity for improvement and investment in infrastructure to enhance the adoption of green transportation options.

The calculated smart village index indicator value of 0.0 signifies a complete absence of localized energy generation facilities within the village, indicating a critical gap in energy resilience. This zero value suggests that the village lacks the necessary infrastructure or initiatives to harness renewable energy sources, which are essential for enhancing local energy security and sustainability. The absence of data may further exacerbate this situation, highlighting the need for comprehensive assessments and interventions to promote energy generation and improve the overall quality of life in the community. Addressing these deficiencies is crucial for fostering a more resilient and sustainable environment.
