

Pellizzano is a picturesque village located in the Trentino region of Italy, nestled in the Val di Sole valley. Known for its stunning alpine scenery, it offers outdoor activities like hiking and skiing, along with rich cultural heritage and traditional architecture, making it a charming destination for visitors.

Village Smartness Index

A village smartness index value of 0.02 indicates a very low level of smartness within the assessed village. This suggests that the village is in the early stages of adopting smart technologies and practices, with minimal initiatives focused on innovation or digital transformation. The index reflects a lack of comprehensive data and development strategies, which may hinder the village's ability to leverage technology for improving quality of life and sustainability. Overall, this low score highlights the need for targeted efforts to enhance smartness and foster community engagement in future initiatives.

Indicator 1.1.1

Measures the availability and quality of digital network connections within a rural community.

A smart village index indicator value of 7.0 suggests a relatively low but positive level of digital connectivity within the rural community. This value indicates that while there are some available digital network connections, they may not be robust or widespread enough to significantly enhance the community's access to digital services. The presence of a value above zero implies that there are efforts in place to improve connectivity, but substantial gaps remain, limiting the potential for digital engagement and innovation in the area. Overall, this score reflects the community's ongoing journey towards better digital integration.

Indicator 1.1.2

Assesses traditional, non-digital means of connectivity (e.g., postal services, telephony) to gauge infrastructure inclusivity in areas with limited digital access.

A calculated smart village index indicator value of 1.0 signifies a moderate level of development in terms of smart village characteristics. This value suggests that the village has made some progress in integrating traditional connectivity methods, such as postal services and telephony, to enhance infrastructure inclusivity, particularly in areas with limited digital access. However, it also indicates that there are significant gaps in digital infrastructure and services, which may hinder further development and accessibility for the community. The presence of a zero value in other villages highlights the challenges faced in data availability and connectivity, emphasizing the need for targeted interventions to improve overall infrastructure and digital inclusion.

Indicator 1.1.4

Examines the affordability and economic accessibility of internet services for rural residents, aiming to highlight potential barriers to digital engagement. [Internet café, libraries]

A calculated smart village index indicator value of 0.0 signifies a complete absence of the necessary components or conditions that contribute to the development of a smart village in the current location. This could indicate a lack of digital infrastructure, such as high-speed

internet access, or insufficient engagement with innovative technologies. The absence of data may also reflect limited resources or support systems, such as internet cafés or libraries, which are crucial for enhancing digital engagement among rural residents. Consequently, this zero value highlights significant barriers to economic accessibility and affordability of internet services, impeding the community's ability to participate in the digital economy and access essential services.

Indicator 2.1.1

This indicator measures the extent to which public transport services are available and accessible to rural populations, including frequency, coverage, and proximity of services. It reflects the inclusiveness and usability of the transport network in addressing mobility needs in sparsely populated areas.

A calculated smart village index indicator value of 1.0 signifies a modest level of public transport services available and accessible to the rural population in the specific village. This value indicates that while there are some transport services present, they may not be sufficient to fully meet the mobility needs of residents. The frequency, coverage, and proximity of these services are likely limited, suggesting that improvements are necessary to enhance inclusiveness and usability for the community. This situation highlights the ongoing challenges faced by rural areas in achieving effective mobility solutions.

Indicator 2.2.2

This indicator assesses the adoption and use of vehicles powered by low-carbon or renewable fuels, such as electric vehicles (EVs), plug-in hybrids, or vehicles running on biodiesel, in rural areas.

A smart village index indicator value of 5.0 signifies a moderate level of adoption and use of vehicles powered by low-carbon or renewable fuels in the assessed rural area. This value indicates that while there is some engagement with sustainable transportation options, it is still below the average observed in the broader research context. The presence of electric vehicles, plug-in hybrids, or biodiesel vehicles suggests a growing awareness and potential for further development in sustainable mobility solutions. However, the value also highlights the need for enhanced infrastructure and incentives to promote greater adoption of these eco-friendly transportation options in the community.

Indicator 3.2.1

Measures the spread of localized energy generation facilities, enhancing local energy resilience.

The calculated smart village index indicator value of 0.0 signifies a complete absence of localized energy generation facilities within the village, indicating a critical gap in energy resilience. This zero value suggests that the village lacks the necessary infrastructure or initiatives to harness renewable energy sources, which are essential for enhancing local energy security and sustainability. The absence of data may further exacerbate this situation, highlighting the need for comprehensive assessments and interventions to develop energy solutions tailored to the community's needs. Addressing this deficiency is crucial for fostering economic opportunities and improving the overall quality of life in the village.
