

Sóller is a picturesque village located in the Tramuntana mountains of Mallorca, Spain. Known for its stunning natural beauty, it features charming streets, historic architecture, and a vibrant local market. The village is famous for its citrus groves and the scenic Sóller railway connecting it to Palma.

Village Smartness Index

A village smartness index value of 0.04 indicates a low level of smartness in comparison to the maximum potential score of 1.0. This suggests that the village has made some progress in implementing smart initiatives, but there is still significant room for improvement. The index reflects the village's current capabilities in areas such as governance, mobility, and economy, which may be underdeveloped. The presence of a value above the minimum indicates some awareness or initiatives towards smart transformation, but the overall low score highlights the need for enhanced data collection and strategic planning to foster further development and innovation in the village.

Indicator 1.1.1

Measures the availability and quality of digital network connections within a rural community.

A smart village index indicator value of 9.0 suggests a relatively low level of digital network connectivity and quality within the rural community being assessed. This value indicates that while there are some digital resources available, they are not sufficiently developed or widespread to significantly enhance the community's connectivity. The presence of a zero value in other villages may reflect a complete absence of digital infrastructure, highlighting the challenges faced in bridging the digital divide. Overall, a score of 9.0 points to the need for further investment and improvement in digital networks to better support the community's growth and access to information.

Indicator 1.1.2

Assesses traditional, non-digital means of connectivity (e.g., postal services, telephony) to gauge infrastructure inclusivity in areas with limited digital access.

A smart village index indicator value of 4.0 signifies a relatively high level of connectivity and infrastructure inclusivity in the assessed village, particularly in terms of traditional, non-digital means such as postal services and telephony. This value suggests that the village has effectively utilized available resources to enhance communication and access to services, even in areas where digital connectivity may be limited. The strong score reflects a commitment to ensuring that all residents can engage with essential services, thereby fostering community cohesion and improving overall quality of life. This level of infrastructure indicates a proactive approach to bridging gaps in connectivity, which is crucial for rural development.

Indicator 1.1.4

Examines the affordability and economic accessibility of internet services for rural residents, aiming to highlight potential barriers to digital engagement. [Internet café, libraries]

A smart village index indicator value of 1.0 suggests a moderate level of readiness and development in terms of digital engagement and

infrastructure within the village. This value indicates that while there are some existing resources and initiatives aimed at enhancing internet accessibility and affordability for rural residents, significant barriers may still exist. The presence of internet cafes and libraries may provide some access points, but the overall environment may still lack comprehensive digital engagement strategies, limiting the potential for broader community participation in the digital economy. This situation highlights the need for targeted interventions to improve connectivity and reduce barriers for residents.

Indicator 2.1.1

This indicator measures the extent to which public transport services are available and accessible to rural populations, including frequency, coverage, and proximity of services. It reflects the inclusiveness and usability of the transport network in addressing mobility needs in sparsely populated areas.

A calculated smart village index indicator value of 3.0 signifies a moderate level of accessibility and availability of public transport services for the rural population in the current location. This value indicates that there is a reasonable frequency and coverage of transport options, allowing residents to meet their mobility needs effectively. The transport network is likely to be more inclusive and usable compared to areas with lower values, facilitating better connectivity and access to essential services for the community. This level of accessibility can enhance the overall quality of life for residents by improving their ability to travel for work, education, and other activities.

Indicator 2.2.2

This indicator assesses the adoption and use of vehicles powered by low-carbon or renewable fuels, such as electric vehicles (EVs), plug-in hybrids, or vehicles running on biodiesel, in rural areas.

A calculated smart village index indicator value of 6.0 signifies a moderate level of adoption and use of vehicles powered by low-carbon or renewable fuels in the assessed rural area. This indicates that the village is making strides towards sustainable transportation solutions, with a notable presence of electric vehicles, plug-in hybrids, or biodiesel-powered vehicles. The value reflects a commitment to reducing carbon emissions and enhancing environmental sustainability, contributing positively to the overall quality of life in the community. This level of adoption suggests that while there is room for improvement, the village is actively engaging in practices that support a greener future.

Indicator 3.2.1

Measures the spread of localized energy generation facilities, enhancing local energy resilience.

A calculated smart village index indicator value of 0.0 signifies that the village has no recorded measures or initiatives related to localized energy generation facilities, which are crucial for enhancing local energy resilience. This zero value may indicate a complete absence of data or initiatives in this area, suggesting that the village lacks the necessary infrastructure or programs to support energy generation. Consequently, the community may face challenges in energy security and sustainability, limiting its potential for development and resilience.
