

Alavieska is a small village in Finland known for its serene environment and close-knit community. It features beautiful natural landscapes, agricultural activities, and a focus on sustainable living. The village promotes local culture and offers a peaceful lifestyle, making it an attractive destination for residents and visitors alike.

Village Smartness Index

A village smartness index value of 0.17 indicates a relatively low level of smartness compared to the maximum possible value of 1.0. This suggests that the village has made some progress in implementing smart technologies and initiatives, but there is still significant room for improvement. The index reflects various dimensions such as mobility, governance, economy, environment, living, and people. A value of 0.17 may imply that while some smart services or innovations are present, they are not yet fully developed or integrated into the community's daily life. This level of smartness could be attributed to limited resources, lack of strategic planning, or insufficient stakeholder collaboration. Overall, the village is on the path toward becoming smarter, but further efforts are needed to enhance its capabilities and services.

Indicator 1.1.1

Measures the availability and quality of digital network connections within a rural community.

A smart village index indicator value of 74.0 signifies a relatively strong availability and quality of digital network connections within the rural community being assessed. This value suggests that the village has made significant strides in enhancing its digital infrastructure, enabling better access to online services, communication, and information. Such connectivity can facilitate various initiatives, including e-health, online education, and digital entrepreneurship, ultimately improving the quality of life for residents. The presence of robust digital networks can also foster community engagement and economic development, making the village more resilient and attractive for both current residents and potential newcomers.

Indicator 1.1.2

Assesses traditional, non-digital means of connectivity (e.g., postal services, telephony) to gauge infrastructure inclusivity in areas with limited digital access.

A calculated smart village index indicator value of 1.0 signifies a moderate level of development in terms of smart village initiatives within the assessed community. This value indicates that while the village has made some progress in integrating traditional connectivity methods, such as postal services and telephony, it still faces challenges in achieving comprehensive digital inclusivity. The presence of a 1.0 value suggests that there are basic infrastructures in place, but significant gaps remain, particularly in areas with limited digital access. This scenario highlights the need for further investment and innovation to enhance connectivity and overall quality of life for residents.

Indicator 1.1.4

Examines the affordability and economic accessibility of internet services for rural residents, aiming to highlight potential barriers to digital engagement. [Internet café, libraries]

A calculated smart village index indicator value of 2.0 signifies a relatively high level of smartness in the village, indicating that it has successfully integrated various digital technologies and services to enhance the quality of life for its residents. This value suggests that the village has made significant strides in areas such as digital connectivity, access to information, and the availability of services like internet cafés and libraries. However, the context of this value is crucial, as it highlights the stark contrast with other villages, where the minimum value is 0.0, reflecting potential barriers to digital engagement, such as affordability and accessibility of internet services. The presence of a 2.0 value indicates that this village may serve as a model for others, showcasing the benefits of investing in digital infrastructure and services.

Indicator 2.1.1

This indicator measures the extent to which public transport services are available and accessible to rural populations, including frequency, coverage, and proximity of services. It reflects the inclusiveness and usability of the transport network in addressing mobility needs in sparsely populated areas.

A smart village index indicator value of 1.0 signifies a basic level of public transport services available to the rural population. This value indicates that while there are some transport services in place, they may not be fully developed or widely accessible. The frequency, coverage, and proximity of these services are likely limited, suggesting that residents may still face challenges in meeting their mobility needs. This score reflects an initial step towards enhancing transport inclusivity and usability in the area, highlighting the need for further improvements to better serve the community.

Indicator 2.2.2

This indicator assesses the adoption and use of vehicles powered by low-carbon or renewable fuels, such as electric vehicles (EVs), plug-in hybrids, or vehicles running on biodiesel, in rural areas.

A smart village index indicator value of 2.0 suggests a very limited adoption of low-carbon or renewable fuel vehicles in the assessed rural area. This score indicates that while there may be some presence of electric vehicles or other sustainable transport options, it is not widespread. The low value could reflect challenges such as insufficient infrastructure for charging stations, limited awareness or availability of these vehicles, or a strong reliance on traditional fossil fuel-powered transportation. Overall, this score highlights the need for enhanced initiatives to promote sustainable mobility solutions in the community.

Indicator 3.2.1

Measures the spread of localized energy generation facilities, enhancing local energy resilience.

The calculated smart village index indicator value of 0.0 signifies a complete absence of localized energy generation facilities within the village, indicating a critical gap in energy resilience. This zero value suggests that the village lacks the necessary infrastructure or initiatives to harness renewable energy sources, which are essential for enhancing local energy security and sustainability. The absence of data may further exacerbate this situation, highlighting the need for comprehensive assessments and interventions to develop energy solutions tailored to the community's needs. Addressing this deficiency is vital for fostering economic opportunities and improving the overall quality of life in the village.
