

Gacko is a small town in Bosnia and Herzegovina, known for its picturesque landscapes and rich cultural heritage. It features a blend of traditional architecture and modern amenities, surrounded by natural beauty, making it an attractive destination for both residents and visitors. Its community is engaged in agriculture and local crafts.

Village Smartness Index

A village smartness index value of 0.01 indicates a very low level of smartness, suggesting that the village is in the early stages of adopting smart technologies and practices. This score reflects minimal innovation and limited implementation of smart services, which may hinder the village's development and quality of life. The proximity of this value to the median and mean suggests that while it is low, it is not entirely isolated within the dataset. The village may face challenges such as insufficient data collection, lack of stakeholder engagement, or limited resources to enhance its smartness initiatives. Addressing these issues could pave the way for future improvements and a more robust smartness index.

Indicator 1.1.1

Measures the availability and quality of digital network connections within a rural community.

A calculated smart village index indicator value of 0.0 signifies that the rural community in question has no measurable availability or quality of digital network connections. This could indicate a complete absence of digital infrastructure, such as high-speed internet or mobile connectivity, which are essential for accessing information and services. The zero value may also reflect a lack of data collection or reporting in this area, highlighting significant challenges in digital integration and technological advancement. Consequently, this community may face barriers to economic growth, social engagement, and overall quality of life improvements.

Indicator 1.1.2

Assesses traditional, non-digital means of connectivity (e.g., postal services, telephony) to gauge infrastructure inclusivity in areas with limited digital access.

A smart village index indicator value of 2.0 suggests a moderate level of smartness in the village's infrastructure and services. This value indicates that the village has implemented some innovative solutions and digital technologies, but there is still significant room for improvement. The presence of traditional, non-digital means of connectivity, such as postal services and telephony, reflects an effort to maintain inclusivity for residents with limited digital access. However, the index value also highlights challenges in fully integrating advanced technologies, which may hinder the village's overall development and connectivity.

Indicator 1.1.4

Examines the affordability and economic accessibility of internet services for rural residents, aiming to highlight potential barriers to digital engagement. [Internet café, libraries]

A calculated smart village index indicator value of 1.0 signifies a moderate level of smartness in the village, indicating that it has

implemented some digital technologies and innovative solutions to enhance its economic and social conditions. This value suggests that while the village is making strides towards digital engagement, there are still significant gaps compared to the maximum potential of 2.0. The presence of internet cafés and libraries may provide some access to digital services, but affordability and economic accessibility remain critical barriers for many residents, potentially limiting their full participation in the digital economy. The index reflects a need for further development in infrastructure and services to improve overall connectivity and engagement.

Indicator 2.1.1

This indicator measures the extent to which public transport services are available and accessible to rural populations, including frequency, coverage, and proximity of services. It reflects the inclusiveness and usability of the transport network in addressing mobility needs in sparsely populated areas.

A calculated smart village index indicator value of 1.0 signifies a modest level of public transport services available and accessible to the rural population in the specific village. This value indicates that while there are some transport services present, they may not be frequent or comprehensive enough to fully meet the mobility needs of residents. The transport network's inclusiveness and usability are limited, suggesting that improvements are necessary to enhance accessibility and better serve the community's transportation requirements.

Indicator 2.2.2

This indicator assesses the adoption and use of vehicles powered by low-carbon or renewable fuels, such as electric vehicles (EVs), plug-in hybrids, or vehicles running on biodiesel, in rural areas.

A smart village index indicator value of 3.0 suggests a moderate level of adoption and use of low-carbon or renewable fuel vehicles in the assessed rural area. This indicates that while there is some engagement with sustainable transportation options, it is not yet widespread. The presence of electric vehicles or other alternative fuel vehicles may be limited, reflecting potential barriers such as infrastructure, awareness, or availability. This value highlights an opportunity for growth and improvement in promoting sustainable mobility solutions within the community.

Indicator 3.2.1

Measures the spread of localized energy generation facilities, enhancing local energy resilience.

A calculated smart village index indicator value of 0.0 signifies that there is no measurable presence of localized energy generation facilities within the assessed area. This indicates a complete absence of initiatives aimed at enhancing local energy resilience, which is crucial for sustainable development. The zero value may stem from a lack of data or insufficient infrastructure to support energy generation. Consequently, this situation highlights the need for targeted interventions to foster energy solutions and improve the overall sustainability of the community.
