

I'm sorry, but I don't have specific information about the village of Karpachevo in Bulgaria. However, if you have any other questions or need assistance with a different topic, feel free to ask! I'm here to help.

Village Smartness Index

A village smartness index value of 0.0 indicates that the village has not yet implemented any measurable smart initiatives or technologies that contribute to its development. This could be attributed to a lack of data, resources, or strategic planning for smart village initiatives. Such a low index suggests that the village may be facing significant challenges in areas such as governance, economy, and infrastructure, which are essential for fostering innovation and improving the quality of life for its residents. Without any smart solutions in place, the village may struggle to attract investment or enhance its services, ultimately hindering its growth and resilience.

Indicator 1.1.1

Measures the availability and quality of digital network connections within a rural community.

A calculated smart village index indicator value of 0.0 signifies that the specific rural community lacks any measurable availability or quality of digital network connections. This absence may indicate a significant digital divide, where residents are unable to access essential online services, information, or communication tools. Such a scenario can hinder economic development, limit educational opportunities, and restrict access to healthcare services. The zero value suggests that the community may not have the necessary infrastructure or resources to support digital connectivity, which is crucial for fostering innovation and improving overall quality of life.

Indicator 1.1.2

Assesses traditional, non-digital means of connectivity (e.g., postal services, telephony) to gauge infrastructure inclusivity in areas with limited digital access.

A calculated smart village index indicator value of 0.0 signifies a complete absence of assessed connectivity and infrastructure inclusivity in the current location. This could indicate a lack of traditional, non-digital means of connectivity, such as postal services or telephony, which are essential for gauging the inclusivity of infrastructure in areas with limited digital access. The zero value may also reflect insufficient data availability, highlighting the need for further investigation and development to enhance connectivity and support for the community. This situation underscores the challenges faced by the village in achieving a more integrated and connected environment.

Indicator 1.1.4

Examines the affordability and economic accessibility of internet services for rural residents, aiming to highlight potential barriers to digital engagement. [Internet café, libraries]

A calculated smart village index indicator value of 0.0 signifies that the village in question exhibits no measurable progress or development in the context of smart village initiatives. This could indicate a complete absence of digital infrastructure, services, or engagement opportunities for residents. The lack of data may reflect insufficient access to internet

services, which are crucial for economic participation and digital engagement. Consequently, residents may face significant barriers to accessing information and resources, limiting their ability to benefit from technological advancements and social innovations. This situation underscores the urgent need for targeted interventions to enhance digital connectivity and accessibility in the community.

Indicator 2.1.1

This indicator measures the extent to which public transport services are available and accessible to rural populations, including frequency, coverage, and proximity of services. It reflects the inclusiveness and usability of the transport network in addressing mobility needs in sparsely populated areas.

A calculated smart village index indicator value of 0.0 signifies a complete absence of public transport services in the assessed area. This indicates that there are no available or accessible transport options for the rural population, which severely limits mobility and access to essential services. The lack of frequency, coverage, and proximity of transport services reflects a significant gap in the transport network, highlighting the challenges faced by residents in reaching work, education, and healthcare facilities. This situation underscores the urgent need for improved transport solutions to enhance inclusivity and usability for the community.

Indicator 2.2.2

This indicator assesses the adoption and use of vehicles powered by low-carbon or renewable fuels, such as electric vehicles (EVs), plug-in hybrids, or vehicles running on biodiesel, in rural areas.

A smart village index indicator value of 0.0 signifies that there is no recorded adoption or use of vehicles powered by low-carbon or renewable fuels in the assessed rural area. This could indicate a lack of infrastructure, such as charging stations for electric vehicles, or limited awareness and availability of such vehicles among the residents. Additionally, it may reflect insufficient data collection efforts in the region, preventing an accurate assessment of sustainable transportation practices. Overall, this low value highlights potential areas for improvement in promoting eco-friendly mobility solutions within the community.

Indicator 3.2.1

Measures the spread of localized energy generation facilities, enhancing local energy resilience.

The calculated smart village index indicator value of 0.0 signifies a complete absence of localized energy generation facilities within the village, indicating a critical gap in energy resilience. This zero value suggests that the village lacks the necessary infrastructure or initiatives to harness renewable energy sources, which are essential for enhancing local energy security and sustainability. The absence of data may reflect insufficient investment, lack of awareness, or challenges in implementing smart energy solutions, ultimately hindering the village's potential for economic and social development. Addressing these issues is vital for fostering a more resilient and sustainable community.
